## 1.1 ELECTRICAL DRIVES

Motion control is required in large number of industrial and domestic applications like transportation systems, rolling mills, paper machines, textile mills, machine tools, fans, pumps, robots, washing machines etc. Systems employed for motion control are called *drives* and may employ any of the prime movers such as, diesel or petrol engines, gas or steam turbines, steam engines, hydraulic motors and electric motors, for supplying mechanical energy for motion control. Drives employing electric motors are known as *electrical drives*.

Block diagram of an electrical drive is shown in Fig 1.1. Load is usually a machinery designed to accomplish a given task, e.g. fans, pumps, robots, washing machines, machine tools, trains and drills. Usually load requirements can be specified in terms of speed and torque demands. A motor having speed-torque characteristics and capabilities compatible to the load requirements is chosen. *Power modulator* performs one or more of the following four functions:

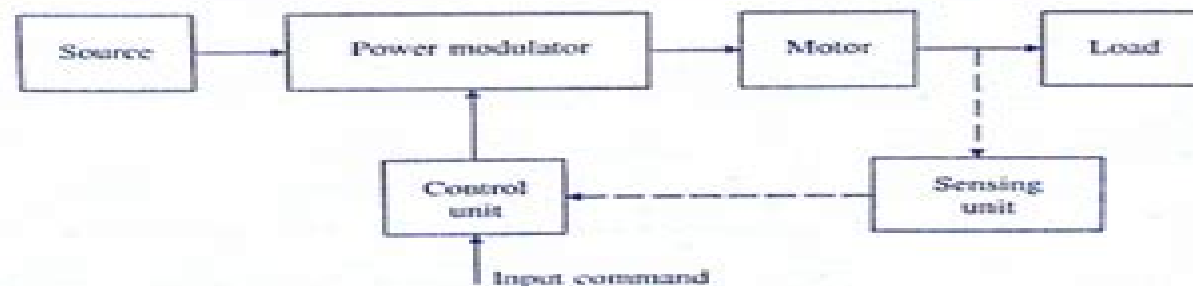

Fig. 1.1 Block diagram of an electrical drive

- (i) Modulates flow of power from the source to the motor in such a manner that motor is imparted speed-torque characteristics required by the load.
- (ii) During transient operations, such as starting, braking and speed reversal, it restricts source and motor currents within permissible values; excessive current drawn from source may overload it or may cause a voltage dip.
- (iii) Converts electrical energy of the source in the form suitable to the motor, e.g. if the
