Exposure To Smoke Of Biomass:

Environmental Health Perspectives, 1972 **Sex-Based Differences in Lung Physiology** Patricia Silveyra, Xenia T. Tigno, 2021-03-18 This book provides an overview of the latest experimental work on sex based differences in lung function and inflammation Readers will learn how these differences relate to individual predispositions for the development of lung disease in men and women and in different stages of their reproductive lives Further the book focuses on diseases that predominantly affect women or men with an emphasis on the physiological mechanisms underlying their pathobiology In turn these findings are complemented by chapters on recent studies which investigate how circulating sex hormone levels impact the lung s innate immune response to environmental agents and air pollution The pathogeneses of asthma and viral respiratory infection are also major focus areas As an outlook the book also discusses current and future research directions aimed at developing sex specific therapies for lung disease To examine these anatomical and physiological differences in the male and female respiratory systems the authors employ a broad range of methods from molecular and clinical biology Accordingly the book will be a fascinating read for physiologists and clinicians alike Chronic Obstructive Pulmonary Disease Kian Chung Ong, 2021-07-14 Chronic Obstructive Pulmonary Disease A Current Conspectus provides an update on COPD related to the following topics merging of experience with technology in confronting COPD air pollution and work related exposures as major causes of COPD heterogeneity of COPD caused by smoke from cigarettes and biomass fuel disease related contributors of health status in COPD exercise training in the context of pulmonary rehabilitation nutritional interventions in COPD mechanical ventilation in COPD use of patient directed music listening during mechanical ventilation

Cassee, Nicholas L. Mills, David E. Newby, 2011-03-29 This book assists scientists toxicologists clinicians and public health regulators to understand the complex issues that determine the impact of air pollution on the cardiovascular system It covers a range of relevant topics including particulate matter PM sources and characterization methods of exposure impact of PM on cells and systems role of particles in the pathophysiology of cardiovascular disease risk assessment and potential environmental and therapeutic interventions **The Indian Journal of Medical Research**, 1988 **Health Effects of Occupational Exposure of Wildland Firefighters to Smoke from Biomass Burning** Chieh-Ming Wu, 2020 Background Wildland firefighters are repeatedly exposed to elevated levels of

wildland fire smoke during wildfire suppression and prescribed burns Information of wildland fire smoke exposure of wildland firefighters is only available for the western and southeastern United States and no assessment of this occupational exposure has been reported for the midwestern region Since different geographic areas have unique vegetative fuels soil characteristics and fire conditions wildland firefighters working in the midwestern states might be exposed to different levels of wildland fire smoke with different particle compositions As past studies of more disease relevant outcomes have been mostly limited to pulmonary and respiratory responses acute cardiovascular effects and systemic oxidation due to occupational wildland fire smoke exposure were investigated among wildland firefighters Objectives The specific aims of this study are to 1 characterize occupational exposure of wildland firefighters to air pollutants including particulate matter with aerodynamic diameter equal to or less than 2.5 microns PM_{2.5} carbon monoxide CO black carbon BC and trace metals in wildland fire smoke emissions from prescribed burns in the midwestern United States 2 assess the effect of wildland fire smoke exposure on acute cardiovascular responses by investigating cross shift changes in hemodynamic parameters blood pressure BP and heart rate HR among wildland firefighters on prescribed burn days and compare those to the corresponding changes on regular work days 3 determine the effect of wildland fire smoke exposure on systemic oxidation by studying cross shift changes in oxidative biomarkers 8 isoprostane malondialdehyde MDA and oxidized guanine species Ox GS in spot urine samples collected from wildland firefighters on prescribed burn days and their associations with urinary mutagenic potency and 4 investigate task related difference holding lighting others in personal exposure concentrations of air pollutants in resting BP and HR and in oxidative biomarkers and urinary mutagenicity Methods Exposure concentrations of PM_{2.5} and CO were monitored in the breathing zone of wildland firefighters working at prescribed burns Following the sampling smoke particulate constituents BC and heavy metals were quantified using the light absorption technique and inductively coupled plasma mass spectrometry ICP MS respectively Exposure concentrations of air pollutants were further categorized based on work tasks holding lighting and others in prescribed burn shifts Resting BP and HR and spot urine sample were measured collected right before pre shift immediately after post shift and next morning next morning of prescribed burn shifts burn days as well as regular work shifts non burn days The levels of urinary oxidative biomarkers were determined using commercially available assay kits and urinary mutagenic potency was assessed using the Salmonella Ames mutagenicity assay Linear mixed effect model was used to examine if the cross shift changes i.e. post shift or next morning vs pre shift in BP and HR measures and the levels of urinary mutagenicity and oxidative biomarkers on burn days are significant Difference in cross shift changes in the hemodynamic parameters and urinary biomarkers were compared between burn and non burn days using linear mixed effect model Results Wildland firefighters in the Midwest had personal PM_{2.5} and CO exposure concentrations that were about 2.7 times higher than the other regions Twenty eight personal CO exposure concentrations were ever above the National Institute for Occupational Safety and Health NIOSH Recommended Exposure Limit REL Ceiling

200 ppm for CO Wildland firefighters who maintained the fires in the boundaries of burning areas had higher CO exposure concentrations compared to those who lighted fires p *The Indian Journal of Chest Diseases & Allied Sciences* ,2004
