

SHEEP EYE DISSECTION PROCEDURES

The anatomy of the human eye can be better shown and understood by the actual dissection of an eye. One eye of choice for dissection, that closely resembles the human eye, is that of the sheep.

Section 1 Step 1:

- Wash the sheep eye in running water to remove the preservative fluid.
- Dry the eye by blotting with a paper towel
- Examine the front of the eye and locate the cornea, sclera (white of the eye) and fatty tissue.
- Examine the back of the eye and find extrinsic muscle bundles, fatty tissue and the optic nerve.
- The four extrinsic muscles (humans have six) move the sheep eye while the fatty tissue cushions the eye.
- If the optic nerve is not visible use the probe to move the fatty tissue around until the nerve is exposed. Take the notes you need to record what you have observed so far.

Section 1 Step 2:

- Cut along the surface of the sclera until all the tissue is removed and looks similar to the above photographs
- Identify the sclera, cornea, optic nerve, and the remaining external muscle parts.
- The cloudy nature of the cornea is caused by the non-living tissue. It is transparent in the living state.
